Care, Companion and Everyday

A fictional planning handover with a source trail and independent completion records.

Fictional sample data only. Not validated for clinical use. Keep real clinical, participant and confidential information out.

01 Coordinate in Care

Set the sample goal, one practical task and a responsible role. Review these details before copying the handover.

02 Prepare in Companion

Create a linked personal plan from the task. Add a question for the next conversation. The original Care task remains in place.

03 Follow in Everyday

Create one linked routine step. Review the source reference and mark completion in the chosen view.

Local review: http://127.0.0.1:4174/pilot/

The connected browser example stays separate from saved Product Lab workspaces.

Review and recover

Independent completion

Mark the Everyday item complete and check that Care and Companion keep their own completion records. Copies retain a source reference; they are not live synchronisation.

Saved browser example

Resume the separate saved pilot or start a fresh example. Download a review when you want a readable summary.

Backup restore

Download the JSON backup. Importing a backup requires schema validation and a review before restore; the previous view downloads first.

Conflicting changes

If another tab or team member saves first, export your view if needed and reload the latest version before editing again.

Optional local team foundation

The /team/ route uses a separate server-saved local organisation workspace with owner, editor and viewer roles. This engineering foundation runs only on loopback; it is not included as a PHP team backend in the Hostinger package.

The prototype does not provide diagnosis, therapeutic advice, monitoring, emergency response or a released clinical collaboration service.
